

T R A I N T O C O M P E T E / O F F - I C E M E T H O D

# THE *first* FIVE DAYS

A 5-day off-ice training program for teen hockey players. Bodyweight-led with creative loading. 35 to 45 minutes a session. Built on the peak-window principles of the Long-Term Athletic Development model — power, speed, and structural strength, trained when they're most trainable.

## LTAD / THE TRAINABLE WINDOW

# TRAIN TO *compete.*

Between the ages of 14 and 18, you're in what sport scientists call the "Train to Compete" phase of the Long-Term Athletic Development (LTAD) model. Translation: your nervous system is wired to absorb power and speed work like a sponge, your tendons and bones are responding to load, and your body is laying down the structural strength you'll lean on for the next decade.

This is the window where the trainable becomes trained. Miss it and you don't lose it forever — but you spend the rest of your career playing catch-up. So we don't waste it. Five days. Bodyweight-led with creative loading. Real intensity. Quality every rep.

## 01

### POWER IS THE PRIORITY

Plyometrics, jumps, and short sprints sit at the center of every session. Rate of Force Development — how quickly your muscles produce force — is the most trainable quality you have right now.

## 02

### SINGLE-LEG FIRST

Skating is a single-leg sport. Every stride is one leg at a time. Split squats, single-leg RDLs, and lateral bounds transfer more to the ice than any barbell back squat ever will.

## 03

### TECHNIQUE IS NON-NEGOTIABLE

Habits cement at your age. Ugly reps now become injuries later. We move well before we move fast. If a rep looks ugly, slow down — every time.

*"The teen years are when the trainable becomes trained. Train smart now — your 22-year-old self is watching."*

## FIVE DAYS / ONE WEEK

# FIVE DAYS. ONE WEEK. ONE *better* PLAYER.

Pick five training days that work for you — they don't need to be Monday through Friday. Leave at least one full rest day mid-week. Each session is 35 to 45 minutes including the warm-up and cool-down. You need a small open space and a floor. A backpack with a few books, or a water jug, covers any loading you'll need. If something *hurts* — actually hurts, not "burns" — stop. Pain is information. Listen to it.

## THE WEEK AT A GLANCE

|                                                                    |                                                   |                                                                   |                                                                 |                                                            |

## HOW TO READ A WORKOUT

## EVERY EXERCISE CARD HAS *five* PARTS.

The number is just the order. Sets × Reps tells you the volume. **Tempo** tells you the speed of each rep — for example, 3-1-1-0 means 3 seconds lowering, 1 second pause at the bottom, 1 second up, 0 rest at the top. **Rest** is how long you wait before your next set. The coaching cue is the one thing your coach would say if he was standing next to you. "What it builds" tells you the hockey reason for the work.

|           |                                               |
|-----------|-----------------------------------------------|
| <b>01</b> | <b>EXERCISE NAME</b> THE MOVEMENT             |
|           | 3 × 8 reps • Tempo 3-1-1-0 • RPE 7 • Rest 75s |
|           | <i>"the coaching cue"</i>                     |

## RATE OF PERCEIVED EXERTION

## LEARN *rpe*. USE IT FOREVER.

RPE is a 1 to 10 scale of how hard a set feels. It's the simplest, most honest way to regulate intensity — better than guessing percentages, better than ego. You'll see it on most strength exercises in this PDF. We'll mostly live in the 6 to 8 range. Save 9+ for true test sets. If today's RPE 7 feels harder than last week's RPE 7, your body is telling you something — listen.

|          |          |          |          |          |           |
|----------|----------|----------|----------|----------|-----------|
| <b>5</b> | <b>6</b> | <b>7</b> | <b>8</b> | <b>9</b> | <b>10</b> |
| EASY     | WARM-UP  | WORK     | HARD     | NEAR MAX | MAX       |

5 MINUTES / NON-NEGOTIABLE

# THE *warm-up.*

Three movements. Five minutes. Every single day before you train. The warm-up isn't optional — it's how you raise body temperature, prime your nervous system, and make sure the first hard rep of the session isn't your first proper rep of the day. Move with control. Breathe through your nose. Don't rush.

01

## WORLD'S GREATEST STRETCH

2 ROUNDS × 3 EACH SIDE

Start in a push-up position. Step your right foot to the outside of your right hand. Drop your right elbow toward the floor for a beat. Then rotate your right arm up to the ceiling, eyes following. Replant. Step back. Switch sides.

*"Open the hip. Open the chest. One movement, three jobs."*

### BUILDS

Hip mobility, T-spine rotation, and a long, ready spine — three things every skater needs before loaded work.

02

## INCHWORM + SHOULDER TAP

2 ROUNDS × 5 REPS

Stand tall. Bend forward and walk your hands out into a long plank. Once stable, tap your right hand to your left shoulder, then left to right — keep your hips square and don't let them rock. Walk your hands back to your feet. Stand. Repeat.

*"Hips locked. Don't rock — squeeze the floor away."*

### BUILDS

Full-body activation, anti-rotation core engagement, and shoulder stability before you load the upper body.

03

## A-SKIP FOR DISTANCE

2 ROUNDS × 20M

Skip forward. Drive the front knee to hip height. Pump the opposite arm hard — hand from hip to cheek. Land tall on the ball of your foot. Stay vertical. This is not jogging — it's a tall, springy, mechanically clean drill.

*"Tall and bouncy. Knee up, arm through — like you've got springs."*

### BUILDS

Sprint posture, ankle stiffness, and the arm-leg coordination that turns into top-end speed.

## 01

## LOWER POWER + STRENGTH

BUILD THE  
*engine.*

Today is the foundation. Heavy single-leg patterns paired with bodyweight power work. We loaded the backpack for a reason — load drives adaptation. Quality is the rule. If a rep gets ugly, drop the weight or skip a rep. Rest fully between sets. You're not trying to be tired — you're trying to be strong.

~ 40 MIN • BACKPACK + BODYWEIGHT • BEGIN WITH THE WARM-UP (P. 04)

## 01

## GOBLET SQUAT (BACKPACK HUGGED TO CHEST)

4 × 6 | TEMPO 3-1-0 | RPE 7 | REST 90S

Backpack hugged tight to your chest, elbows pointing down. Feet a little wider than shoulders, toes slightly out. Push your hips back, knees track over your toes, descend until your thighs are at least parallel. Chest stays tall. Drive through the whole foot to stand. The slow 3-second descent is the point — that's where strength is built.

*"Slow down on the way down. Stand up like you mean it."*

**BUILDS** Bilateral leg strength and the trunk control that lets your hips drive force into the ice on every stride.

## 02

## BULGARIAN SPLIT SQUAT

3 × 6 EACH LEG | TEMPO 2-1-0 | RPE 7-8 | REST 60S

Rear foot up on a chair, couch, or bench (about knee height). Front foot a long stride forward. Drop your back knee straight toward the floor — don't crash. Front knee tracks over the front foot. Drive through the front heel to stand. The front leg does the work. The back leg is just for balance.

*"Front foot loaded. Tall chest. Back knee whispers to the floor."*

**BUILDS** Single-leg strength under load — the exact pattern of a hard skating push. Most teen players are weaker on one side. You'll find yours today.

## 03

## SINGLE-LEG ROMANIAN DEADLIFT

3 × 6 EACH LEG | SLOW TEMPO | RPE 6-7 | REST 60S

Stand on your right leg, slight knee bend, soft micro-bend you hold the whole rep. Hinge from your hip — push your butt straight back as your free leg lifts behind you. Body stays one long line from heel to head. Lower as far as your hamstring allows without your back rounding. Stand back up by squeezing the glute of the standing leg.

*"Long spine. Hip back, not knee down."*

**BUILDS** Posterior chain strength — hamstrings, glutes, lower back — plus the single-leg balance that protects you from groin and adductor issues.

## 04

## BROAD JUMP — STICK IT

4 × 3 REPS | FULL EFFORT | REST 90S

Feet shoulder-width. Big arm swing back, deep counter-movement, jump forward as far as you can. The non-negotiable: stick every landing. Bent knees, hips back, perfectly balanced — hold three full seconds before resetting. If you can't stick it, you jumped too far.

*"Jump far. Land like a statue. Soft feet, stiff core."*

**BUILDS** Concentric power (the jump) and eccentric absorption (the landing) — both required for explosive, injury-resistant skating starts.

## 05

## SIDE PLANK + TOP-LEG LIFT

3 × 8 EACH SIDE | CONTROLLED | REST 45S

Side plank on your forearm — elbow under shoulder, body in a straight line from ankles to head. Hold the plank position perfectly still while you slowly lift and lower the top leg. Hips stay stacked — do not let them rotate or sag. The lift is small. The challenge is staying square.

*"Hips stacked. Don't twist — the floor wants you to twist."*

**BUILDS** Anti-rotation and lateral hip strength — the foundation of stable skating and the spine-saving counter to all the rotation hockey demands.

## 06

## GLUTE BRIDGE MARCH

3 × 8 EACH LEG | CONTROLLED | REST 45S

On your back, knees bent, feet a hand-width from your butt. Drive your hips up into a full glute bridge — straight line knees to shoulders. From there, slowly march one knee up toward your chest while keeping your hips perfectly level. Lower that foot. Switch. Don't let your hips drop.

*"Hips up. Hips level. Glutes do the work."*

**BUILDS** Glute endurance and pelvic control — the engine of every stride and the off-switch for the lower-back pain that haunts teen hockey players.

**COOL-DOWN — 2 MIN** Lie on your back, knees bent. Breathe in for 4 seconds, out for 6 seconds. Ten breaths. Your nervous system shifts from "go" to "recover" — that shift is when adaptation begins.

## 02

## SPEED DAY

GET *fast.*  
STAY FRESH.

Speed is the most trainable quality you have right now — and the most ruined by fatigue. Today you rest fully between every effort. If you're gassed, you're not training speed anymore. You're training your body to be slow under fatigue, which is the opposite of the point. Every rep is fresh. Every rep is your fastest.

~ 35 MIN • OPEN SPACE + 2 MARKERS • BEGIN WITH THE WARM-UP (P. 04)

## 01

## WALL DRIVE — DRIVE HOLD

4 × 8S EACH LEG | REST 30S

Arm's length from a wall. Hands flat, lean at roughly 45° — body in a perfect straight line head to heels. Drive one knee up to hip height and HOLD for 8 seconds. The standing leg pushes the floor away the entire hold. Switch legs. Posture is everything: no broken hips, no sagging core.

*"Push the floor away. Knee up like punching the sky."*

**BUILDS** Sprint posture and the exact angle of acceleration from a stop — the mechanics of your first three steps off the blue line.

## 02

## A-SKIP FOR DISTANCE

3 × 20M | WALK BACK REST

Skip forward, but make it athletic. Drive the front knee high — hip height, every rep. Hand from hip to cheek on the opposite arm, hard pump. Land tall on the ball of the foot. Stay vertical the whole time. This is technique work — speed comes later.

*"Tall. Bouncy. Mechanically perfect — speed is built here."*

**BUILDS** Sprint mechanics — the foot strike, knee drive, and arm action that translate directly to top-end skating speed.

## 03

## FALLING-START SPRINT

6 × 10M | FULL REST 90S

Stand tall, on the balls of your feet, body as a single straight line. Lean forward from the ankles — keep falling until the only way to stop yourself is to sprint. That first step happens when gravity has already started the work. Sprint hard for 10 meters. Walk back. Reset.

*"Fall first. Step second. Don't think about going — go."*

**BUILDS** First-step explosiveness — the ability to win the race to a loose puck and beat a defender to a gap.

## 04

## LATERAL BOUND — STICK IT

4 × 4 EACH SIDE | REST 60S

Stand on your right leg, knee soft. Push off sideways to your left, exploding through the right foot. Land on your left leg only — stick it. Bent knee, balanced, no wobble. Hold 2 seconds. Push back to the right. That's two reps. Distance matters less than the quality of the landing.

*"Push hard. Land harder. Freeze before you fly again."*

**BUILDS** The exact mechanics of a skating crossover and a hard edge change. Lateral force production is what separates fast skaters from quick skaters.

## 05

## SHUTTLE — 5M / 10M / 5M

4 × FULL REST 90S

Two markers 5 meters apart, plus a third 10 meters past the first. Start at marker A. Sprint to B (5m), plant and turn, sprint back through A to C (10m), plant and turn, sprint back to A. Every change of direction matters — get low, plant the outside foot, drive the new way.

*"Low on the turn. Drive out, don't drift out."*

**BUILDS** Acceleration, deceleration, and change of direction — the three speeds that decide most plays in a hockey shift.

**COOL-DOWN — 2 MIN** Easy walk 90 seconds. Then 10 slow ankle circles each direction, each foot. Sprint days hammer the calves and feet — pay them back.

## 03

## UPPER BODY + ANTI-ROT CORE

PROTECT THE  
*middle.*

Hockey is a rotational sport. Shots, checks, battles — your trunk is constantly being twisted by outside forces. The fix isn't more crunches. It's training the core to *resist* rotation while the rest of you produces it. Pair that with smart upper-body pushing and pulling and you become hard to move off the puck.

~ 40 MIN • BACKPACK + STURDY TABLE/BAR • BEGIN WITH THE WARM-UP (P. 04)

01 **PUSH-UP — TEMPO** **4 × 8-10 | TEMPO 2-1-1-0 | RPE 7 | REST 60S**

Hands directly under shoulders, body in one straight line head to heels. Brace your core like someone is about to hit it. Lower over 2 seconds, pause 1 second at a fist's-height from the floor, drive up. If you can't keep the line, drop to your knees — quality first.

*"Straight line. Squeeze the floor away. Don't sag."*

**BUILDS** Upper-body push strength and the rigid trunk you need for board battles and stick-to-stick contact.

02 **INVERTED ROW (UNDER A STURDY TABLE OR BAR)** **3 × 8 | TEMPO 2-0-1-1 | RPE 7 | REST 75S**

Lie under a sturdy table or low bar. Grip with hands just outside shoulders. Body in a straight line, heels on the floor (or feet elevated for harder). Pull your chest up to meet the bar/table edge, pause 1 second at the top, lower over 2 seconds. Shoulders pull down and back — don't shrug.

*"Pull with the back, not the arms. Squeeze the shoulder blades."*

**BUILDS** Pulling strength and posture — the counterbalance to all the pushing hockey players do, and a critical guard against rounded-shoulder posture.

03 **PIKE PUSH-UP** **3 × 6 | TEMPO 2-1-1-0 | RPE 7 | REST 75S**

Start in a downward-dog — hips high, body an upside-down V, hands a little wider than shoulders. Bend your elbows and lower the top of your head between your hands. Stop just before contact. Press back to the start. If too hard, feet stay low (less vertical angle) — make it work first.

*"Hips high. Press the floor away from your head."*

**BUILDS** Vertical pushing strength and shoulder stability — the foundation for harder overhead work as you progress.

04 **RENEGADE ROW (BACKPACK)** **3 × 6 EACH SIDE | CONTROLLED | REST 60S**

High plank, one hand on a backpack handle (or grip the strap), one hand on the floor. Body in a straight line. Without letting your hips rotate AT ALL, row the backpack up to your ribs. Lower with control. Switch sides. The whole point is that your hips don't move — the bag does.

*"Hips locked. The bag moves — you don't."*

**BUILDS** Anti-rotation core under load — the exact quality you need when an opponent is trying to twist you off the puck.

05 **HALF-KNEELING ANTI-ROTATION HOLD** **3 × 20S EACH SIDE | REST 45S**

Half-kneeling position — one knee down, one foot forward, both knees bent 90°. Press a backpack out in front of your chest with both hands (or hold a rolled towel pulled tight). The trick: a partner pulls sideways on the bag, or you hold a band pulling laterally. Resist. Don't rotate. Don't lean. Hold the position.

*"Stay square. Whatever pulls you — you out-pull it."*

**BUILDS** The deep core's ability to keep the spine stable while the limbs work — the trait that lets a great defender stay strong on his stick.

06 **HOLLOW BODY HOLD** **3 × 30S | REST 45S**

On your back. Press your lower back firmly into the floor — this is non-negotiable. Lift shoulder blades off the ground, arms by your ears, legs straight and 6 inches off the floor. Body looks like a shallow banana. Breathe shallow but steady. If your back lifts, raise your arms or legs higher — easier.

*"Glue your back to the floor. Glue it."*

**BUILDS** Anterior core strength and the rigid trunk that transfers force from your hips to your hands — every shot, every stick check.

**COOL-DOWN — 2 MIN** Child's pose, 60 seconds, deep breathing. Then thread-the-needle stretch, 30 seconds each side. Open up the T-spine after all that pushing and pulling.

## 04

## CONDITIONING + MOBILITY

TRAIN THE  
*shift.*

Hockey isn't a marathon and it isn't a sprint. It's 45 seconds of war, followed by 2 minutes on the bench, repeated for 60 minutes. Today we train that exact pattern — work to rest, work to rest. After the conditioning, we put the joints back together with a focused mobility flow. Skip the mobility and tomorrow you'll feel like a brick.

~ 35 MIN • OPEN SPACE • BEGIN WITH THE WARM-UP (P. 04)

## PART 1 / THE SHIFT SIMULATOR

5 ROUNDS / *a shift, repeated.*

45S WORK • 90S REST • 1:2 WORK-TO-REST • ~13 MIN TOTAL

Each 45-second work block is broken into three 15-second efforts, back to back — no rest between them. Then walk and breathe for 90 seconds. Repeat 5 times. The work-to-rest ratio is exactly what your shifts look like in a real game. Sport science calls this specificity (the SAID principle): your body adapts specifically to the demands you place on it. Place hockey demands on it and it adapts to hockey.

15S

EFFORT 1

BURPEES

15S

EFFORT 2

SKATER HOPS

15S

EFFORT 3

MOUNTAIN CLIMBERS

90S

REST

WALK + BREATHE

*"Go hard on the work. Recover on the rest — actually recover. That's the whole drill."*

## PART 2 / THE MOBILITY FLOW

4 MOVEMENTS / *open the body back up.*

~ 6 MIN • SLOW • CONTROLLED

## 01 90/90 HIP SWITCHES — 2 × 8

Sit with both knees bent 90°, one leg in front, one to the side. Rotate the hips to switch sides without using your hands. Slow, controlled. Opens the hips in both internal and external rotation.

## 03 COUCH STRETCH — 2 × 45s EACH

Kneel, back foot up against a wall (top of foot flat on the wall, shin vertical). Front foot forward. Squeeze the glute of the back leg hard and stand tall through the back hip. You'll feel the front of the back-leg hip.

## 02 T-SPINE OPEN BOOK — 2 × 8 EACH SIDE

Lie on your side, knees bent, both arms straight out in front. Slowly rotate the top arm in a wide arc to the floor behind you — knees stay together. Open the chest. Breathe into the stretch.

## 04 ACTIVE HAMSTRING FLOSS — 2 × 6 EACH

SIDE

On your back. Hug one knee to your chest. Slowly straighten that leg toward the ceiling, then bend it back. Move through full range — don't bounce, don't yank. The hamstring lengthens because you're asking, not forcing.

## 05

## HOCKEY-SPECIFIC INTEGRATION

TIE IT ALL  
*together.*

Today is the test of the week. Strength, power, and conditioning, all in one session — sequenced like a real training day. Three blocks. A-Block pairs strength and power to wake up the nervous system. B-Block is a hockey-pattern circuit. C-Block is the shift finisher. Quality every rep. Don't let the volume rush you.

~ 45 MIN • BACKPACK + OPEN SPACE • BEGIN WITH THE WARM-UP (P. 04)

**A** CONTRAST PAIR / STRENGTH + POWER

4 ROUNDS • 90S REST

Do A1 then immediately A2. Rest 90 seconds. Repeat 4 times. This is a contrast pair — heavy controlled work followed by an explosive expression. Sport science calls this post-activation potentiation: the slow strength rep "wakes up" the fast-twitch fibers so the jump that follows is sharper. Treat the broad jump like a max effort every time.

**A1** Rear-Foot-Elevated Split Squat (loaded backpack)

5 EACH LEG • RPE 7-8

**A2** Broad Jump — Stick It

3 REPS • MAX EFFORT

*"Strong first. Fast second. The strong rep makes the fast rep faster."*

**B** HOCKEY-PATTERN CIRCUIT

3 ROUNDS • 60S REST BETWEEN ROUNDS

Move through B1 to B4 with minimal rest between exercises. Rest 60 seconds at the end of each round. Three full rounds. This is where you put yourself in positions that look like hockey — lateral, single-leg, anti-rotation, tight core — under fatigue.

**B1** Lateral Bound — Stick It

6 EACH SIDE

**B2** Push-Up

8 REPS

**B3** Reverse Lunge (bodyweight, alternating)

5 EACH LEG

**B4** Hollow Body Hold

25 SECONDS

*"Form first. Speed second. Tempo never gets ahead of technique."*

**C** THE SHIFT FINISHER

5 ROUNDS • 60S REST

Pick one: 20 seconds of all-out sprinting (open space), or 20 seconds of all-out shuttle running between two markers 10 meters apart. Rest 60 seconds. Repeat 5 times. The legs will burn by round three. That burn is the point. That's the conditioning that lets you win the third period.

*"Last rep is the loudest. Empty the tank on round five."*

## SIX CUES / THE COACH IN YOUR HEAD

# TRAIN *smart.* NOT JUST HARD.

Every great athlete has a coach in their head. These are the lines that should be running through yours when there's no one in the gym with you. Memorize them. Repeat them. They'll save you from the bad reps that compound into bad habits.

## CUE 01 / ON TECHNIQUE

*"If a rep looks ugly, slow down."*

Ugly reps cement bad patterns into your nervous system. A clean rep at slower speed beats a fast, broken rep every single time. Quality is the whole game.

## CUE 02 / ON THIS WINDOW

*"Train the trainable now — it isn't coming back."*

Speed and power are most adaptable in your teen years. The work you do now sets a ceiling you'll either reach in your twenties — or never reach. There is no later.

## CUE 03 / ON LANDING

*"Be a great lander before you're a great jumper."*

The athletes who stay healthy aren't the ones who jump highest — they're the ones who absorb force best. Every plyometric rep is two skills: the explosion, and the catch. The catch matters more.

## CUE 04 / ON COMPETITION

*"Compete with yesterday's version of you."*

Forget your teammate's numbers. Forget what's on Instagram. The only honest competition is whether today's effort is better than last week's. Track it. Beat it.

## CUE 05 / ON RECOVERY

*"You don't get better in the gym. You get better between gyms."*

Training is the stimulus. Sleep, food, and rest are where adaptation actually happens. Ignore the recovery half and you do half the work for half the results.

## CUE 06 / ON SHOW-UP DAYS

*"Some days you train hard. Some days you train smart. Never skip."*

Every athlete has off days — flat legs, no spark, head somewhere else. On those days you don't push max effort, you push perfect technique at low load. The streak matters more than any single session.

## SPORT SCIENCE / CNS VS MUSCULAR READINESS

## WHY SOME DAYS YOU FEEL *flat.*

Some training days you feel sharp — fast, light, ready. Other days the same exercises feel like wading through mud. That's not weakness. That's your central nervous system (CNS) running on a different schedule than your muscles. Heavy sleep deficit, exam stress, a hard practice the day before — all of it taxes the CNS. Muscles recover in hours. The CNS takes longer. The cue: on a flat day, lower the intensity, raise the focus. Train the technique, not the maximum. Then go sleep.

## SLEEP / FUEL / HYDRATION

# RECOVERY IS WHEN YOU GET *better*.

Training is the stimulus. Recovery is when your body actually adapts to it. Muscles grow, tendons stiffen, the nervous system reorganizes — all of it happens while you're *not* training. Get this part wrong and the five days of work do half of what they could. Get it right and you'll feel the difference inside two weeks.

## SLEEP

## 8-10

HOURS PER NIGHT

Growth hormone — the chemical that builds muscle and bone — releases in deep sleep. Teens between 14 and 18 actually need *more* sleep than younger kids, not less. Phones off 60 minutes before bed. Same sleep window every night if you can. This is the single most powerful performance lever you control.

## FUEL

## 3

PARTS / EVERY PLATE

A protein (chicken, fish, eggs, beef, lentils), a carb (rice, potato, pasta, fruit, bread), a vegetable. That's the rule. Eat within 60 minutes after every training session — protein + carb. Don't skip breakfast. We don't count calories at your age. We eat real food often.

## HYDRATION

## 8-10

GLASSES / DAY

Performance drops measurably at just 2% dehydration — that's how much fluid you lose in one hard session. Drink throughout the day, not just at training. The honest test: if your pee is darker than pale lemonade, you're already behind. Keep a bottle with you everywhere.

*"You can't out-train bad sleep, bad food, and bad hydration. Not at any age. Especially not at yours."*

MORE IS ON THE WAY

# THIS IS JUST THE *beginning.*

The Five Days is a taste. Built with the same method, the same principles, the same standard — the rest is coming soon. If this week made sense to you, the work that's coming will too.

## THE FULL PROGRAM

01

### 12-WEEK POWER & SPEED PROGRAM

COMING  
SOON

A full block of structured off-ice training — progression, periodization, and the depth this 5-day intro can't fit. Built for hockey players who want to take the work seriously.

## THE TRAINING APP

02

### ELITE HOCKEY DRILLS APP

COMING  
SOON

Video-led off-ice training in your pocket. Every drill demoed, every program tracked, every session adjustable to your level and equipment.

## BE FIRST TO KNOW

*Follow along for launch updates, weekly off-ice drills, training tips, and behind-the-scenes content from the coaching floor.*

M.ED. SPORT SCIENCE / STRENGTH & CONDITIONING /  
HOCKEY

I'm a sport science coach who has spent the last decade working with hockey players — from first-time skaters all the way up to international competition. I also work full-time as a Physical Education and Sport Science teacher.

I built Elite Hockey Drills because the off-ice training world is full of generic, copy-paste programs that don't respect the sport or the player. Hockey is specific. Training should be specific too.

What you just did over these five days is real work — the same principles I use with the players I coach in person. The teen years are the most trainable years of your athletic life. The kids who train smart at 14 are the players everyone watches at 19. Don't waste the window.

— *Coach David*

*"The teenager who trains smart becomes the player who plays long."*
